

ABSTRACT

A medicine storing and dispensing apparatus includes:
a cap container 501 storing a plurality of caps 2 for
closing openings of vial bottles 3 and having a plurality
5 of slits 508 formed on the bottom surface thereof; a
plurality of cap stirring members 511 formed in a rotating
shaft 509 in the state of protruding inside the cap
container 501 through each of the slits 508; a cap stirring
member 502 for steering the caps 2 by the stirring sections
10 510 through rotational driving; and a cap pathway 503 which
continues to the cap container 501, has a clearance
allowing only one cap 2 to pass through, and which is
inclined downward so as to align the passing caps 2.
